ABOUT APPLICATION OF DIVISION INTO PERIODS IN PORTFOLIO ANALYSIS

2008 © V.V. Glinsky*

Keywords: division into periods, the model of the life cycle of goods, the method of dendrites, main components, the method of major factors, normative strategies, the stage of life cycle.

In the article the possibilities of using the methods of division into periods the complex numbers of dynamics during construction of one of the important models of portfolio analysis - the matrix of the life cycle of goods are examined. All the calculations are performed with real data of one of the Novosibirsk publishing houses. The conclusions are made.

Tasks completed with the help of the methods of division into periods¹ are not limited to obtaining the homogeneous intervals of the development of time series. The sphere of application can vary greatly.

Let's examine the possibilities of applying the method for the construction of one of the important matrices of portfolio analysis - goods life cycle model².

This task looks preferable due to finished posing of problems and first outline types, first of all (it was previously taken for granted that theoretically life cycle of goods can include the following periods of single qualitative dynamics - introduction, increase, maturity and decrease); then, normative strategies of development of the actually got types are developed; finally, there is an approximate system of the recommended parameters, whose values allow on the one hand to search for the critical transition points of quantitative changes into the qualitative jumps in the development of the process, on the other hand it is possible to build a complex number of dynamics on the basis of these parameters.

Let's examine the features and the problems of the construction of the life cycle model at present - for the strategic units of one of Novosibirsk publishing houses. In particular, the following series of books, produced by the publishing house in 2001-2008, were examined: in the segment of the detective and adventure literature - a series "Russian crime", in the segment of sentimental prose - the series "The Stranger" and "The formula of love", in the segment of leisure, household, way of life - the series "Good mood" and "Culinary recipes".

= 14 =

The stages of life cycle are shown as a rule through the values of the following parameters:

1. Rate of increase in sales;

2. Dynamics of the demand;

3. Presence and the renewability of the product line;

4. Level of concentration of the market segment;

5. Value of the input barriers;

6. Market share distribution among the chief players of the market and the stability of the market shares.

Far from all these parameters are considered both at the level of enterprise and at the level of branch. Some of them has to be evaluated through the indices connected with them. Thus, for example, the dynamics of the demand was estimated by means of chain rates of the dispatch of the firm "Top- book". The considerations are the following: in the first place, more than 5% of books of Russian production are realized through the retail network of this enterprise, in the second place, "Topbook" does not usually undertake direct marketing effects (until recently there was no division of distribution in the usual sense), accordingly the dynamics of the dispatch can play the role of the indicator of the demand. The level of the concentration of segment is determined through the four parts coefficient of concentration. The constancy of market share was estimated with the help of market share distribution of four chief producers in the corresponding market segment.

Let us calculate according to the initial data the matrix of distances on the Euclidean certificate and the correlation matrix. As the objects

Table 1

| Indices | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2007 |
|---|------|------|------|------|-------|------|------|
| Chain rate of increase in the dispatch (coefficient) | 4,86 | 2,54 | 1,51 | 1,49 | 0,804 | 0,5 | 0,99 |
| Chain rate of increase in the demand (coefficient) | 1 | 1,54 | 1,47 | 1,18 | 0,75 | 0,57 | 1,18 |
| the four parts coefficient of concentration, % | 80,5 | 84,6 | 91,1 | 92,6 | 92,2 | 93,3 | 94,0 |
| Product line - number of publications in the year | | 29 | 49 | 64 | 79 | 53 | 23 |
| Market share distribution among the 4 chief players of the market | 22 | 23,4 | 25,5 | 27,9 | 29,9 | 30 | 31,4 |

Indexes for evaluating the stages of the life cycle of a series "Russian crime"

we will examine are years, the results will be presented in tables 2 and 3, respectively.

Let's build an optimum dendrite, with the smallest sum of bond lengths, according to the data in table 3.

Table 2

The matrix of distances on a series "Russian crime"

| | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2007 |
|------|------|------|------|------|------|------|------|
| 2001 | 0,00 | 0,64 | 0,91 | 1,00 | 1,24 | 1,12 | 0,88 |
| 2002 | 0,64 | 0,00 | 0,35 | 0,57 | 0,92 | 0,85 | 0,48 |
| 2003 | 0,91 | 0,35 | 0,00 | 0,28 | 0,64 | 0,64 | 0,44 |
| 2004 | 1,00 | 0,57 | 0,28 | 0,00 | 0,37 | 0,47 | 0,54 |
| 2005 | 1,24 | 0,92 | 0,64 | 0,37 | 0,00 | 0,36 | 0,76 |
| 2006 | 1,12 | 0,85 | 0,64 | 0,47 | 0,36 | 0,00 | 0,56 |
| 2007 | 0,88 | 0,48 | 0,44 | 0,54 | 0,76 | 0,56 | 0,00 |

Table 3

The matrix of the correlations on a series "Russian crime"

| | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2007 |
|------|--------|--------|--------|--------|--------|--------|-------|
| 2001 | 1,000 | 0,441 | -0,103 | -0,377 | -0,549 | -0,222 | 0,236 |
| 2002 | 0,441 | 1,000 | 0,799 | 0,427 | -0,002 | 0,228 | 0,800 |
| 2003 | -0,103 | 0,799 | 1,000 | 0,870 | 0,562 | 0,649 | 0,870 |
| 2004 | -0,377 | 0,427 | 0,870 | 1,000 | 0,897 | 0,906 | 0,772 |
| 2005 | -0,549 | -0,002 | 0,562 | 0,897 | 1,000 | 0,933 | 0,512 |
| 2006 | -0,222 | 0,228 | 0,649 | 0,906 | 0,933 | 1,000 | 0,738 |
| 2007 | 0,236 | 0,800 | 0,870 | 0,772 | 0,512 | 0,738 | 1,000 |

Let's carry out "natural" partition of the dendrite:

Thus K = 4, so if we move away 3 longest connections from the dendrite we will obtain

four periods of single qualitative development of a series "Russian crime":

Introduction - 2001; Increase - 2002, 2003, 2004; Maturity - 2005, 2006; Decrease - 2007.

Let's apply two algorithms to the correlation matrix - the method of main components and the method of the major factors included the purpose of verification of the obtained results (table 4, 5). Let's leave the factor loads greater than 0,4 for convenience of the interpretation.

The taken main components account for up to 91,6% of general dispersion. In value and direction the method of main components divides the studied time interval into the following periods: the first component (-) - 2001, the first component (+) - 2004, 2005, 2006, the second component (+) - 2002, 2003, 2007.

The three first major factors constitute 99,5% of the general variation and we will examine them. The value and the sign of factor loads allow to isolate the following periods of the isomorphic development of the series: 2001 (factor 3, +), 2002 (factor 2, +), 2003, 2004, 2005, 2006 (factor 1), 2007 (factor 2, +).

Let's estimate the level of the coordination of the results, obtained on the basis of differential initial information (matrix of distances and correlations) and with the use of different

| 2001 | | | 0,462 |
| 2002 | -0,579 | 0,773 | |
| 2003 | -0,918 | | |
| 2004 | -0,977 | | |
| 2005 | -0,814 | -0,554 | |
| 2006 | -0,896 | | |
| 2007 | | 0,413 | |

Basic factors

Table 6

| The contribution of | the dispersion of m | ajor factors in the | e general variation |
|---------------------|---------------------|---------------------|---------------------|
|---------------------|---------------------|---------------------|---------------------|

| | Own value | Dispersion, % | Accumulated own value | Accumulated dispersion, % |
|---|-----------|---------------|-----------------------|---------------------------|
| 1 | 4,426 | 63,222 | 4,426 | 63,222 |
| 2 | 1,984 | 28,349 | 6,410 | 91,571 |
| 3 | 0,556 | 7,937 | 6,966 | 99,508 |
| 4 | 0,034 | 0,492 | 7,000 | 100,000 |

algorithms. Let's present the results of the analysis in Table 7.

As we see, on the one hand, different algorithms of a study give somewhat distinguished results, on the other hand the agreements are significant, at least "the nucleus of periods" catches all the methods. Analogous calculations were also carried out on other publishing series.

The following problem, which must be solved during the construction of the life cycle model is the determination of competitiveness. In this specific case, this task does not look like a complex one for a very simple reason the size of the enterprise, its market share and other parameters a priori do not allow to occupy two leading positions: the prevailing and the strong one.

For 2006 these positions for the series in question were determined by expert evaluation. We as a result have the following model of the life cycle of the strategic units of the publishing house in 2006, presented in Table 8.

Table 7

The estimation of the convergence of different algorithms in the separate stages of the life cycle of the "Russian crime" series

| Period | Method of the dendrites | Method of the main components | Method of the major factors | Note, the reaction of method to "the exposure of the nucleus" of the period |
|--------------|----------------------------|----------------------------------|--------------------------------|---|
| Introduction | 2001 | 2001 | 2001 | + |
| Increase | 2002, 2003, 2004 | 2002, 2003 | 2002 | + (2002) |
| Maturity | 2005,2006 | 2004,2005,2006 | 2003,2004,2005,2006 | +(2005,2006) |
| Decrease | 2007 | 2007 | 2007 | + |

Table 8

The life cycles of the strategic units of publishing house in 2006

| Stage of the life cycle | Name of the series | | | | | | |
|----------------------------|-------------------------|-----------------------------|-----------|--------|------------|--|--|
| Introduction | Culinary recipes | | | | | | |
| Increase | | Russian crime, the Stranger | Good mood | | | | |
| Maturity | | Formula of love | | | | | |
| Decrease | | | | | | | |
| | Weak | Noticeable | Durable | Strong | Prevailing | | |
| | Stage of the life cycle | | | | | | |

Conclusions:

1. In the grouped form the developments of separate series recommended as strategic units look as follows: "Culinary recipes", "Russian crime", "The Stranger" are in danger of being withdrawn from the market or of the failure of the market or the liquidation of business; "The formula of love" has a careful gradual development; "Good mood" has all the range of possible actions.

2. It goes without saying, investigating any question in the level of concrete enterprise, as for instance, the construction of the model of the life cycle of goods, the results you get by time are catastrophic in some sense. For example, the recommendation of a strategy "withdrawal from the market or the liquidation of business" affects concrete personnel of enterprise, and in the case with the publishing house it also concerns the authors (some authors can lose the possibility of publishing their works), etc. However, these problems controlled, there are possibilities of changing the activity of the enterprise and its workers.

This example in its time "puzzled" us in another way. Studying the life cycle of goods based on the example of series of books of a separate publishing house, we focused the attention on the fact that sufficiently many "signals" appeared, signs of the stagnation of the all book branch of Russia (extremely high level of the concentration of all examined segments, decrease in the demand, high input and output barriers, etc).
